

New Abstract

Please replace the existing Abstract with the following New Abstract. The previous Abstract is to be deleted.

Abstract of the Disclosure

A database stores shapes and dimensions of feet, corresponding manufacturer shoe sizes, and style preferences for shoes satisfactory to particular identified persons. The information of the database is used to select possibly satisfactory new shoes for these persons, and for other persons with feet having similar dimensions, shapes, and corresponding shoe sizes. The database is used to facilitate and optimize the selection of shoes, to manage inventory, and to predict demand for shoes.
